Install guide - Folded panel on backtray (illuminating)

1) Before beginning, know where the power feed is and make necessary preparations for connecting the illumination. If the connection point is within the backtray, then a cable hole will need to be drilled before backtray is installed.
Using a spirit, ensure the backtray is positioned level. When position decided, use suitable fixings and rawl plugs to secure backtray to substrate.

2) With the backtray fixed to the substrate, offer the panel over, and using countersunk self-tappers - fix the panel to the backtray.
